

## Acer pseudoplatanus 'Leopoldii'

|                                    |                                                                                 |
|------------------------------------|---------------------------------------------------------------------------------|
| Высота                             | 14 - 20 m                                                                       |
| Ширина                             | 10-15m                                                                          |
| Крона                              | broad pyramidal, dark, dense crown                                              |
| Кора и ветви                       | twigs olive green to grey, bark grey                                            |
| Лист                               | 5-lobed, young leaf pink, stippled white and yellow in summer, about 12 - 20 cm |
| Цветы                              | yellow-green, in pendent racemes, April                                         |
| Плоды                              | winged nut (samara), 3 - 3.5 cm long                                            |
| Колючки/шипы                       | None                                                                            |
| Ядовитость                         | ядовитые части                                                                  |
| Вид почвы                          | any                                                                             |
| Влажность почвы                    | устойчив к коротким наводнениям                                                 |
| Мощение                            | неустойчив к мощению                                                            |
| Зона зимостойкости                 | 4 (-34,4 до -28,9 °C)                                                           |
| Устойчивость к ветру               | very good, even sea wind                                                        |
| Прочие виды устойчивости           | устойчив к морозам, зона 1 - 6, сустойчив к ветру                               |
| Дерево-среда обитания для животных | устойчив к морозам, зона 1 - 6, сустойчив к ветру, медонос                      |
| Применение                         | побережье, промышленные зоны                                                    |
| Форма                              | штамбовое дерево                                                                |
| Происхождение                      | Domien Vervaene, Gent, Belgium, 1864                                            |

This cultivar from Belgium has been named after king Leopold. It is a healthy growing tree with a wide pyramidal crown. The tree can reach from 14 m up to 20 m and its leaf colour is quite striking. Juvenile foliage is pink, later it turns white and yellow speckled. Flowers are of the species, emerging while the leaves unfurl in April. 'Leopoldii' is one of the better variegated maples, applied on a large scale. The tree is used as a park tree and solitary. It requires little from the soil and is wind resistant. Winter hardiness zone: 4
