

Catalpa ×erubescens 'Purpurea'

Высота	10 - 12 (15) m
Ширина	6-10m
Крона	wide pyramidal, later ovoid to round, half-open crown
Кора и ветви	grey, shallow fissured
Лист	heart-shaped, purplish-red, later dark green, 13 - 18 cm
Цветы	white, in large erect panicles, July/August (September)
Плоды	thin capsules, to 35 cm long
Колючки/шипы	None
Ядовитость	неядовитый, обычно
Вид почвы	few requirements, not in wet soils
Мощение	неустойчив к мощению
Зона зимостойкости	6a (-23,3 до -20,6 °C)
Устойчивость к ветру	moderate to poor
Прочие виды устойчивости	устойчив к морозам, зона 1 - 6
Дерево-среда обитания для животных	устойчив к морозам, зона 1 - 6, медонос
Форма	штамбовое дерево, многоствольное дерево
Происхождение	A. Waterer, England, before 1886

An average-sized tree with a half-open crown, which is pyramidal initially, but later ovoid to round-headed. The hard wood of the twigs breaks easily. The acuminate and entire, ovate leaf appears late in spring and it is dark purplish-red to almost black. Also the young twigs are dark in colour. In summer the leaf turns dark green, it is slightly smaller than of *C. erubescens* and is shed relatively early. The white, tubular flowers are smaller than of *C. bignonioides* and appear in erect, long panicles of 25 to 35 cm. Inside the flowers are yellow and have small brown spots. They are followed by long, capsules that are 1 cm thick at the most. These persist during winter.
