

Ilex crenata

Высота	2-3 (5) m
Ширина	1-2m
Крона	dark, dense crown
Кора и ветви	brown
Лист	green, evergreen
Цветы	white, flowers in May, June
Плоды	black
Колючки/шипы	None
Ядовитость	ядовитые части
Вид почвы	loamy soil, sandy soil, peaty soil, calcareous soil
Влажность почвы	устойчив к сухим почвам
Мощение	неустойчив к мощению
Зона зимостойкости	6 (-23,3 до -17,8 °C)
Устойчивость к ветру	very good
Прочие виды устойчивости	устойчив к морозам, зона 1 - 6, сустойчив к ветру
Применение	кашпо для деревьев, сады на крыше, побережье, небольшие сады, сады в патио
Форма	многоствольное дерево

Japanese holly is a highly variable species that usually remains a shrub form, but can grow into a small tree after many years. The crown is oval to round, sometimes somewhat irregularly shaped. The leaves are also highly variable in shape and size. From ovoid leaves up to 3 cm long to inverted ovoid, often spherical leaves only 1 cm long. The leaves are matt to glossy mid-green to dark green. Like all Ilex, I. crenata is dioecious. Male and female flowers are therefore on different plants. The flowers are small and inconspicuous. The female flowers, after pollination, are followed by small, shiny black berries.

Ilex crenata is a particularly versatile shrub. Suitable for planting both solitary and in groups, but also suitable for making low to medium hedges. The plant is sometimes used as a Buxus substitute. On heavy and insufficiently permeable soil, growth may stagnate, making the plant sticky.

There are dozens of cultivars of I. crenata on the market. Some differ by having a compact or low growth habit. Other cultivars have yellow, yellow-spotted or white-spotted leaves. Very well known are the cultivar with convex leaves: 'Convexa' and the yellow-leaved 'Golden Gem'.
