Quercus ×hispanica 'Fulhamensis'

12-15 m
10-12m
round/spherical, half-open crown
grey
evergreen
light yellow, flowers in April
brown
None
неядовитый, обычно
loamy soil, sandy soil, calcareous soil
устойчив к влажным почвам
неустойчив к мощению
7 (-17,7 до -12,3 °C)
good
сустойчив к ветру, устойчив к соли для улиц
промышленные зоны
штамбовое дерево, разветвленное дерево, многоствольное дерево

A semi-evergreen to full evergreen tree growing to 12 - 15 m. The red crown has gracefully hanging twigs which are thinner than other cultivars of Q. x hispanica. The thick bark is dark grey, deeply grooved and corky. The leaves are dark green on top whereas the underside has grey-white hairs. The blossom and fruit are the same as on the species. During severe cold, the leaves turn brown in the winter, only falling when the new leaves emerge. A healthy, warmth-loving tree which prefers a limy soil. There are a few types in circulation with the same name.
