

Sorbus thibetica 'John Mitchell'

Высота	15 - 20 m
Ширина	10-15m
Крона	oval, later almost round, half-open crown
Кора и ветви	smooth and dark grey, older trunks flake off
Лист	broad ovoid to round, dark green, approx. 20 x 17 cm
Цветы	cream ♂ white, in upright umbels of 7 - 15 flowers, May/June
Плоды	brownish-red, Ø 1.5 - 2 cm
Колючки/шипы	None
Ядовитость	неядовитый, обычно
Вид почвы	makes few demands, can grow on poor soils
Мощение	неустойчив к мощению
Зона зимостойкости	8 (-12,2 до -6,7 °C)
Устойчивость к ветру	good
Прочие виды устойчивости	сустойчив к ветру
Дерево-среда обитания для животных	сустойчив к ветру, дерево-источник питания для птиц
Применение	аллеи и широкие улицы
Форма	штамбовое дерево, многоствольное дерево
Происхождение	F. Kingdon-Ward, England
Синонимы	Sorbus 'Mitchellii'

Medium-sized to large tree with an ascending manner of growth: it quickly becomes oval. Old specimens develop an almost rounded crown. The trunk is smooth and dark grey: older trunks flake off somewhat. The young twigs are green and carry soft hairs. From the second year the branches become bare and dark brown. When they emerge the remarkably large leaves are covered with white felt-like hairs. They are silver-grey on the underside and remain so the entire summer. In the autumn the leaves turn yellowish and the underside remains silver-grey up to the last minute. The flowers grow in long-stemmed upright umbels and are followed by round to elliptical fruits that turn orange-red to brownish-red. This tree was introduced from China by Frank Kingdon-Ward. 'John Mitchell' is the only clone of *S. thibetica* that is cultivated.
