

Ulmus 'Lobel'

Высота	15 - 18 m
Ширина	4-6m
Крона	broad pyramidal, dark, dense crown
Кора и ветви	smooth, silver-grey, later with blackish-grey grooves, twigs olivegreen
Лист	obovate, dark green, 6 - 9 cm
Цветы	in dense bunches on short stems, light green, March/April
Плоды	flat winged nutlets, round to elliptical, brown
Колючки/шипы	None
Ядовитость	неядовитый, обычно
Вид почвы	moist and light, favours calcareous soils
Влажность почвы	устойчив к влажным почвам, устойчив к коротким наводнениям
Мощение	устойчив к мощению
Зона зимостойкости	5 (-28,8 до -23,4 °C)
Устойчивость к ветру	very good, also against sea wind
Прочие виды устойчивости	устойчив к морозам, зона 1 - 6, сустойчив к ветру
Применение	аллеи и широкие улицы, побережье, промышленные зоны
Форма	штамбовое дерево, многоствольное дерево
Происхождение	De Dorschkamp, Wageningen, Netherlands, 1973

A Dutch cultivar from a cross between two seedlings in which *U. glabra* 'Exoniensis', *U. hollandica* 'Bea Schwarz' and *U. wallichiana* (from the Himalayas) were brought together. Forms a vertically ascending tree with lateral branches growing out at an angle. In its young years it is narrow pyramidal but later becomes broad pyramidal. Breadth 4 to 5 m. It is a vigorous grower forming a very dense crown with short branches growing close together. The fairly small rough leaves are dull dark green with dense veins and a double-serrated edge. They are bronze coloured when they emerge. They remain on the tree for a long time, often until late November. The light reddish-brown leaf buds are a remarkable feature. 'Lobel' is reasonably resistant to Dutch elm disease. Because it is very resistant to sea wind it is eminently suitable for use in the coastal provinces.
