

Thujopsis dolabrata

Высота	15 - 20 (30) m
Ширина	3-6m
Крона	narrow conical, half-open crown, capricious growing
Кора и ветви	branches reddish brown, bark reddish brown, papery gray peeling
Лист	flat scales, 3 – 8 mm long, bright green with white lenticel stripes on the underside
Цветы	solitary, reddish purple, 3 - 5 mm, inconspicuous, 0.8 – 1.6 cm
Плоды	angular, almost round cones, 0.8 - 2.0 cm, blue-green
Колючки/шипы	None
Ядовитость	неядовитый, обычно
Вид почвы	clayed soil, loamy soil, sandy soil, peaty soil, acid soil, all soil types
Мощение	неустойчив к мощению
Зона зимостойкости	6 (-23,3 до -17,8 °C)
Устойчивость к ветру	fairly to good
Прочие виды устойчивости	устойчив к морозам, зона 1 - 6, сустойчив к ветру
Применение	промышленные зоны
Форма	штамбовое хвойное дерево, солитерное хвойное дерево

Thujopsis dolabrata is a distinctive sturdy shrub, growing into a large tree. In young age the crown is broad pyramidal, in older trees it is pyramidal. Forms a straight trunk with reddish-brown branches. The old bark flakes off papery with large grey flakes. The foliage is scaly, with the scales being significantly larger than in Chamaecyparis or Thuja. These are bright green with a broad, white lenticel stripe on the underside. Unlike its (almost) namesake Thuja, the foliage does not smell as distinctive when bruised. T. dolabrata is an important forest tree in Japan, where it was one of the trees originally allowed to be cut and used only by the imperial family. The wood is light, soft and contains no resin. It is easy to work with and suitable for many purposes. The Hibacypress can be used as a solitary or in groups in gardens and parks and in cemeteries. Can grow in both sun and shade and likes nutrient-rich, humus-rich soil that is sufficiently moist but still well-drained.
