

Juglans ailantifolia

Высота	15 - 20 m
Ширина	15-20
Крона	round, half-open crown
Кора и ветви	young twigs brown-green, bark light grey with reticulate grooves
Лист	imparipinnate, 40 - 50 (60) cm, with 11 - 17 leaf segments, elongated to elliptical, 10 - 16 cm, dark green, feathered leaf
Цветы	red flowers in racemes and 10 - 20 cm, green catkins, 10 - 25 cm, May
Плоды	round to somewhat ovoid, about 3 cm, in clusters of up to 20
Колючки/шипы	None
Ядовитость	неядовитый, обычно
Вид почвы	any, if fertile
Мощение	неустойчив к мощению
Зона зимостойкости	5b (-26,0 до -23,4 °C)
Устойчивость к ветру	good
Прочие виды устойчивости	устойчив к морозам, зона 1 - 6, сустойчив к ветру
Форма	штамбовое дерево, многоствольное дерево
Происхождение	Japan, Sakhalin
Синонимы	Juglans sieboldiana

Large park tree with broad, round crown, up to 20 m tall and broad. The first-year twigs are densely covered with glandular hairs, but have hardly any hairs in their second year. The large, imparipinnate leaves are 40 - 60 cm long and up to 90 cm long in young, vigorously growing trees. They consist of 11 to 17 dark green leaf segments and the leaf margins have shallow serrations. The male flower catkins can be 25 cm long. The flowers appear in May, soon after the leaves emerge. The fruits hang in clusters of up to 20. The husks carry sticky hairs. The nut has a short, pointed tip and a fairly thick membrane where the two halves meet. Grows on almost any soil, as long as fertile. Does need space to develop a good, regular crown.
