

Photinia ×fraseri 'Red Robin'

Высота	3 - 5 m (depending on how cultivated)
Ширина	3-5m
Крона	round, later flattened spherical, dark, dense crown
Кора и ветви	greenish-grey to grey-brown
Лист	winter green, obovate, young leaves reddish-brown, later green, 8 - 15 cm, evergreen
Цветы	white, in broad umbels, May/June
Плоды	round, Ø approx. 0.5 cm, red, later black
Колючки/шипы	None
Ядовитость	неядовитый, обычно
Вид почвы	likes calcareous soil, makes little demands on soil type
Мощение	устойчив к частичному мощению
Зона зимостойкости	6a (-23,3 до -20,6 °C)
Устойчивость к ветру	moderate
Прочие виды устойчивости	устойчив к морозам, зона 1 - 6
Дерево-среда обитания для животных	устойчив к морозам, зона 1 - 6, дерево-источник питания для птиц
Применение	небольшие сады, сады в патио
Форма	штамбовое дерево
Происхождение	Duncan & Davies, New Zealand, before 1979

Usually a large shrub, sometimes a small evergreen tree. The bushy crown starts out rounded but later the branches become more pendulous to form a broader crown. 'Red Robin' can be pruned without difficulty so that the final shape of the crown can be easily influenced. The evergreen leaves are leathery and glossy (the Greek word 'phôteinós' means glossy). The leaves emerge a light brownish-red in the spring but later turn to dark green and, in the autumn, the top leaves turn bordeaux red. This makes the tree a year-round attraction in the garden. Depending on how the tree is pruned, in the spring it produces flowers in large white umbels. These are followed by sturdy red berries that turn black. Root growth is fine and close to the surface. Because of the risk of frost damage the tree prefers a sheltered site. Is often planted in pots.
