

Quercus ithaburensis

| | |
|--------------------------|--|
| Высота | 6 - 15 m |
| Ширина | 6-15m |
| Крона | broad oval, half-open crown |
| Кора и ветви | dark greyish-brown, deeply grooved |
| Лист | elongated, oval or almost round, dull green, 6 - 12 cm |
| Цветы | pale yellow catkins, May |
| Плоды | elliptical to oval acorns |
| Колючки/шипы | None |
| Ядовитость | неядовитый, обычно |
| Вид почвы | makes few demands, preferably not too wet |
| Мощение | неустойчив к мощению |
| Зона зимостойкости | 7 (-17,7 до -12,3 °C) |
| Устойчивость к ветру | fairly |
| Прочие виды устойчивости | устойчив к соли для улиц |
| Применение | промышленные зоны |
| Происхождение | the south-west of Asia |

A rare semi-evergreen tree with a crown that starts off oval and is later broad oval. The old bark is dark greyish-brown and has remarkably deep grooves. The dull green leaves are sometimes elongated but can also be oval or practically round. They are usually heart-shaped at the base, giving them a characteristic violin-like shape. They are 6 - 12 cm long and the edge has a few pointed serrations. The acorns are remarkably large, approx. 4 cm in size. They are elliptical to oval and half (or even a little more) enclosed by the cupule: the latter is densely covered with remarkably woody, backward-bending scales. This distinguishes this species from the equally little known *Q. macrolepis* that has much softer and hairier scales on the cupule. *Q. ithaburensis* could be used more frequently because of its remarkable leaves and fruit.
