

Zelkova sinica

Высота	15 - 18 m
Ширина	10-15m
Крона	round to fan-shaped, light, open crown, capricious growing
Кора и ветви	twigs glossy brown, bark brown to grey-green peeling in thin flat plates
Лист	ovoid to elongated, glossy green, 5 - 9 cm
Осенний окрас	желтый
Цветы	inconspicuous , unisexual, monoecious, green, May
Плоды	small obovate fruit, 0.5 - 0.6 cm, green, later brown
Колючки/шипы	None
Ядовитость	неядовитый, обычно
Вид почвы	humic, moist and loamy
Мощение	устойчив к мощению
Зона зимостойкости	6 (-23,3 до -17,8 °C)
Устойчивость к ветру	moderate to reasonable
Прочие виды устойчивости	устойчив к морозам, зона 1 - 6
Применение	кашпо для деревьев, сады на крыше
Форма	штамбовое дерево, многоствольное дерево
Происхождение	Central and eastern China

Sturdy tree with a broad, round to fan-shaped crown. The trunk often has low branching and the half-open crown is formed by several heavy boughs. The young twigs are glossy brown and covered in dense woolly hair in the first season. The mature bark is brown to grey-green and peels off in thin, flat plates. The ovate to elongated leaf has a sharply serrated margin so the lateral veins terminate as a small thread-like point. Closely resembles *Z. serrata* but this has 8 to 14 lateral veins per leaf whereas *Z. sinica* has 7 to 12 lateral veins per leaf. The leaf is glossy green and turns brownish yellow in autumn. The tree blossoms with inconspicuous green flowers that appear in May, after the leaf development. They are followed by small obovate fruits.
